Title: Database/SQL Developer

Industry: Utility (various projects related to power generation, transmission, and distribution).

Job Description Summary:

The developer is responsible for gathering requirements, developing databases and tools, testing and validation, and performing integration with other current and future systems.

Responsibilities:

- Determine the best ways to store data, perform updates, and ensure flexibility for end-users.
- Write technical documentation to explain algorithms and logic needed to build calculation engines.
- Document complex data sets and calculations and ensure tools meet best practices.
- Develop access/SQL databases, forms, macros, and other tools to perform specified functions.
- Create test plans or programs to validate calculations and data.
- Drive and suggest innovations and technologies to improve performance, calculation time, and communication.
- Using advanced quantitative and analytic skills, respond to requests for data, including sourcing, creating charts/tables, and analyzing and interpreting complex data sets.
- Report on project status, estimate work requirements, all while managing a variety of distinct initiatives.

Required Qualifications:

- Bachelor's degree in business, information technology, or related fields.
- 3 years of data modeling or other data experience demonstrating knowledge of database management systems and data management tools.
- Exceptional database skills, including SQL query development experience.
- Background in programming, VB macros, and other technologies.

Travel Requirements:

- Travel 25% as required
